

# HITCAP PROJECT DOCUMENTATION

## 2. Requirements Analysis

### Import Data using Transform Maps (Spreadsheet)

The requirements were identified from the need to manage bulk employee data imports in a structured and reliable manner. The system must accept spreadsheet data, temporarily store it in an Import Set table, transform it into the target Employee Test table, and provide validation and reporting.

#### Business Requirements

- Import employee information from an Excel spreadsheet.
- Store imported spreadsheet data in an Employee Import staging table.
- Maintain employee records in a custom Employee Test table.
- Map source fields to target fields through a Transform Map.
- Avoid duplicate employee records using Coalesce.
- Support insertion of new employees and updating of existing employees.
- Provide department-wise, location-wise, and employee list reports.
- Provide a centralized Employee Analytics Dashboard.

| Field         | Type   |
|---------------|--------|
| Employee ID   | String |
| Employee Name | String |
| Email         | String |
| Department    | String |
| Location      | String |
